

Animals and people in disasters

When a disaster strikes, the international community's first response must be to safeguard and meet the immediate needs of those people whose lives have been affected. Providing the tools for recovery also forms a vital element of effective disaster management, helping communities to rebuild in the medium and long term. But, with the vast majority of the world's poorest people heavily reliant on animals for their livelihoods and food security, protecting animals must be an integral part of any effective disaster response.

At **World Animal Protection**, we have 50 years of experience in helping people to help animals in disasters. We partner with local and national governments, intergovernmental and non-governmental organisations and communities to deliver expert emergency response and world-leading risk reduction and preparedness planning to bring about positive solutions for animals and people alike.

Focus on an essential relationship

Livestock is owned by 70% of the world's poorest people – also the group most vulnerable to the impacts of disasters – with many aspects of their income and diet derived from animals.¹ The loss of livestock and working animals can therefore leave whole communities facing a significant second disaster in the form of long-term malnutrition, food insecurity, debt and dependency.

This is the big picture for disaster experts: healthy working animals and livestock provide food and income and so are critical to recovery. The inclusion of animal welfare measures in national and regional disaster management plans strengthens the humanitarian response, builds community resilience and protects food security and livelihoods. When it comes to sustainable development, these measures are absolutely vital.

Beyond their immediate financial and dietary offer, animals have an important role in many societies as companions. Often considered family members, the wellbeing of loved pets is an additional concern for owners coping in disasters and can even affect their willingness to evacuate dangerous scenarios.²

From a development perspective, the contribution animals make to many of the world's most pressing challenges – such as nutrition, food security, agricultural output, financial stability and social wellbeing – is enormous. It is very real and tangible, and increasingly recognised and understood in humanitarian and development circles.

Picture animals in your plans

Protecting the wellbeing of animals must be one of the building blocks of effective disaster management planning, because they have intrinsic value and because communities must have the chance to thrive. This is not an 'optional extra' if we are to sustainably safeguard communities' livelihoods, food security and ultimate resilience to disasters.

Today, measures to integrate animal welfare into governmental and organisational emergency planning, policy and response are ever more established. These measures include providing knowledge and resources that help owners to support their animals in times of crisis and to maintain good animal health and welfare as efforts to rebuild begin, limiting the loss or disruption of animal-based livelihoods.

Big-picture disaster planning that recognises the inextricable links between human and animal welfare is beginning to be successfully implemented by a growing number of local and national authorities. In the last few years, **World Animal Protection** has been working with the governments of Australia, Colombia, Costa Rica, India, Dubai and Mexico.

We offer advice and assistance to a range of partners on integrating animal welfare into disaster planning. We do this to achieve our vision of a world in which animals and the people who depend on them are protected from disasters.
